Disclaimer

ContractWolf.io audits and reports should not be considered as a form of project's "advertisement" and does not cover any interaction and assessment from "project's contract" to "external contracts" such as Pancakeswap or similar.

ContractWolf does not provide any warranty on its released reports.

ContractWolf should not be used as a decision to invest into an audited project and is not affiliated nor partners to its audited contract projects.

ContractWolf provides transparent report to all its "clients" and to its "clients participants" and will not claim any guarantee of bug-free code within its **SMART CONTRACT**.

ContractWolf presence is to analyze, audit and assess the client's smart contract's code.

Each company or projects should be liable to its security flaws and functionalities.

Scope of Work

SHIWA team agreed and provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract.

The goal of this engagement was to identify if there is a possibility of security flaws in the implementation of the contract or system.

ContractWolf will be focusing on contract issues and functionalities along with the projects claims from smart contract to their website, whitepaper and repository which has been provided by **SHIWA**.

Description

SHIWA is a solution of the future now from the hand of the SHIWA mascot that combines the hype of a meme with real utility in a blockchain, DAO options and NFTs marketing platform so that users can enjoy the advantages of decentralized governance and end organizational hierarchy.

Risk Level Classification

Risk Level represents the classification or the probability that a certain function or threat that can exploit vulnerability and have an impact within the system or contract.

Risk Level is computed based on CVSS Version 3.0

Level	Value	Vulnerability
Critical	9 - 10	An Exposure that can affect the contract functions in several events that can risk and disrupt the contract
High	7 - 8.9	An Exposure that can affect the outcome when using the contract that can serve as an opening in manipulating the contract in an unwanted manner
Medium	4 - 6.9	An opening that could affect the outcome in executing the contract in a specific situation
Low	0.1 - 3.9	An opening but doesn't have an impact on the functionality of the contract
Informational	0	An opening that consists of information's but will not risk or affect the contract

Auditing Approach

Every line of code along with its functionalities will undergo manual review to check its security issues, quality, and contract scope of inheritance. The manual review will be done by our team that will document any issues that there were discovered.

Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:

- Review of the specifications, sources, and instructions provided to ContractWolf to make sure we understand the size, scope, and functionality of the smart contract.
- Manual review of code, our team will have a process of reading the code line-by-line with the intention of identifying potential vulnerabilities and security flaws.

2. Testing and automated analysis that includes:

- Testing the smart contract functions with common test cases and scenarios, to ensure that it returns the expected results.

3. Best practices review, the team will review the contract with the aim to improve efficiency, effectiveness, clarifications, maintainability, security, and control within the smart contract.

4. Recommendations to help the project take steps to secure the smart contract.

Used Code from other Frameworks/Smart Contracts (Direct Imports)

Imported Packages

- IERC20
- Address
- SafeERC20
- IERC165
- IERC721
- ERC165
- Context
- IERC721Metadata
- IERC721Receiver
- Strings
- Counters
- MerkleProof
- PaymentSplitter
- ReentrancyGuard
- Ownable
- ERC721
- SHIWA
- OwnableDelegateProxy
- ProxyRegistry

Description

Optimization enabled: Yes

<u>SWC-103</u>	Floating Pragma	LOW ISSUE
<u>SWC-102</u>	Outdated Compiler Version	PASSED
<u>SWC-101</u>	Integer Overflow and Underflow	PASSED
<u>SWC-100</u>	Function Default Visibility	PASSED

AUDIT PASSED

Function Comments

Description:

tx.origin is a global variable in Solidity which returns the address of the account that sent the transaction. Using the variable for authorization could make a contract vulnerable if an authorized account calls into a malicious contract. A call could be made to the vulnerable contract that passes the authorization check since tx.origin returns the original sender of the transaction which in this case is the authorized account. (SWC-115)

Suggestion:

tx.origin should not be used for authorization. Use msg.sender instead.

Description:

A floating pragma is set (SWC-103)

```
pragma solidity ^0.8.0;
```

Suggestion:

Specific version to ensure that the bytecode does not vary between builds.

```
pragma solidity 0.8.0;
```

Audit Comments

- Owner can pause/unpause contract
- Owner can renounce ownership
- Owner can transfer ownership
- Owner can set base token URI
- Owner can reveal URI
- Owner can set merkle root
- Owner can toggle presale status
- Owner can toggle public sale status
- Owner can set minimum token requirement to mint
- Owner can set base extension
- Owner can set not revealed URI
- Owner cannot burn tokens
- Owner cannot block user
- Owner cannot mint after initial deployment
